# Ericsson USA 5G Smart Factory recognized as 'Global Lighthouse' by the World Economic Forum, 15.03.2021

Francisco Betti, Head of Shaping the Advanced Manufacturing and Production, World Economic Forum, says:

**“This is a time of unparalleled industry transformation. The future belongs to those companies willing to embrace disruption and capture new opportunities. Today’s disruptions, despite their challenges, are a powerful invitation to re-envision growth. The lighthouses are illuminating the future of manufacturing and the future of the industry.”**

# Mercedes-Benz Cars significantly increases efficiency and flexibility

Case: Factory 56

## The Challenge

Need for a flexible and connected infrastructure to replace traditional assembly line with driverless transport systems, in order to significantly gain efficiency and flexibility to produce large numbers of very different vehicles

## The Solution

Private commercial 5G Network:

- Ericsson Private Network solution with 5G Radio Dot for high performance indoor
- First phase covers 20.000 of the 220.000 m<sup>2</sup> of Factory 56

## The expected results

- Optimize existing production processes through data linking or product tracking on the assembly line
- Process optimization, which can be adapted on short notice
- Intelligently linking production systems and machines to support the efficiency and precision of the production process
- Sensitive production data stays on premise

## Partners

- Telefónica Germany
- Mercedes-Benz

# 5G monitored manufacturing of bladed disks

Case: BLISK

## The challenge

Innovation in aircraft engine design is limited by the growing complexity of the components.

Ensuring maximum quality for these safety-critical components and avoiding costly and energy-heavy rework enable a boost in productivity and innovation.

Partners:

## Solution

Real-time monitoring and control of the production process of bladed disks for jet engine turbines, the world's first enabled through 5G New Radio, is the pre-requisite to produce more efficient aircraft engines and secure the extremely high-quality product.

## Results

- Annual savings of 27M€ per factory, resulting from reduced rework due to predictable quality
- Improved engine design could lead to annual savings of 16 M worldwide metric tons\* of CO<sub>2</sub>

## Partners

- MTU Aero Engines
- Fraunhofer IPT

*\*assuming 2% more efficient jet engines resulting from higher-quality BLISks*

*BLISK = BLade Integrated diSK*

# Real-time care

## 5G enables the UK's first remote diagnosis

With unprecedented new demands on the NHS and emergency services due to the coronavirus pandemic, the need for innovative new ways of delivering healthcare is now more critical than ever.

“We are excited by the huge potential of 5G technology and how it can help transform healthcare in the future. We believe it has the potential to create more efficient use of healthcare resources, particularly with regards to easing the burden on A&E services”

Dave Rosser,  
UHB Chief Executive

## The 5G difference

The clinician was able to perform the procedure remotely through an immersive combination of 5G-enabled technology.

A camera based in the ambulance transmits high-definition footage to the remote clinician with close to zero latency. Using a VR headset and a joystick, the clinician can then remotely guide the paramedic through a series of procedures based on haptic glove technology.

All of this allows the clinician to recognize vital signs, access medical records remotely and ultimately respond much faster.

# Ericsson-powered 5G unleashes Spot the robot for airport inspection

If you flew in or out of Hans Christian Andersen airport near the Danish city of Odense recently and glanced out the window, you might have seen a **four-legged robot called Spot freely patrolling the perimeter fencing and checking for damage**. But this was no fairy tale. The robot was real and connected to TDC NET's Ericsson-powered 5G. The 5G use-case trial was a partnership with the Danish Technological Institute.

## 5G robotics breakthrough

In collaboration with the Danish Technological Institute, the partners focused on how to unleash Spot – the Institute's four-legged mobile robot developed by robotic company Boston Dynamics – on TDC NET's national commercial 5G network.

Spot had previously only performed tasks for the institute using Wi-Fi connectivity. This meant connectivity range was limited. Spot's operator also had to be within 30 meters.

**By connecting Spot to TDC's commercial 5G network, the partners literally opened the doors to new use case possibilities for the robot.** The fast speed, high bandwidth and extremely low latency of 5G provides the tools to send huge amounts of data securely from the robot across the network and back in real-time over large distances.

A close-up photograph of a robotic hand holding a square microchip. The chip has a grid of gold pins on one side. Above the chip, three white, glowing, rounded rectangular bars are arranged vertically, resembling a stylized 'E' or a signal icon. The background is dark and out of focus, showing other parts of the robotic arm.
